

# District Office

Lörrach, Germany

Photo: Janik Gensheimer

## The Project

The new district administration office in Lörrach is a fine example of modern design and sustainable construction methods. With open room structures and clear lines, it offers a bright, efficient working environment. Particular emphasis was placed on the integration of modern ceiling systems that fulfil both visual and functional requirements.

The TICELL single-blade open-cell structure imbues these interiors with a contemporary lightness, creating a uniquely distinctive look through the special way it reflects light. The balanced ratio of the size to height of this open-cell structure delivers optimum permeability for light and emphasises the open-plan character of this architecture.

In a range of different areas, the POLYLAM vertical baffle system creates visual highlights and has a positive effect on interior acoustics. This system blends seamlessly into the architecture, contributing to the sense of design harmony.
